- <sup>1</sup> Polyclinic for the respiratory tract diseases, Zagreb, Croatia *Pulmonology*
- <sup>2</sup> School of Medicine , Zagreb, Croatia University of Zagreb

## **Objective:**

Aim: Medical students represent a significant part of the healthcare community and will be future active members in the coronavirus disease 2019 (COVID-19) treatment. This study aimed to evaluate COVID-19 vaccine intention among medical students in the School of Medicine University of Mostar.

Methods: An online anonymous survey about previous experiences with vaccines and attitudes about vaccination against the disease COVID-19 was conducted in October 2021 among medical students of the School of Medicine University of Mostar.

Results: 52 medical students completed the online survey, from which 42 (81%) were vaccinated for COVID-19 disease. Four (7,7%) of the participants did not receive all the compulsatory vaccinations, and 4 (7,7%) of the participants had annual vaccination against influenza. The results demonstrate that students with a positive attitude about the new vaccines against COVID-19 are more inclined to participate in research for the development of new vaccines (Fisher exact test, p=0.046), and even agree with mandatory vaccination against COVID-19 (Fisher exact test,p<0.001).

Conclusion: This information about the opinions of medical students may be used in future immunization strategies to increase vaccination rates among this group of future medical professionals.
